Expansion Joints and Flexible Connections
(Engineering Guide)

Industry Leader in COMBINED Technology

Unaflex® is the industry leader in “combined” technologies for the Expansion Joint and Flexible Hose industries. Since 1972 Unaflex® has been dedicated to state-of-the-art technologies combined with proven processes.

Our expertise and manufacturing capabilities include a full range of Rubber Expansion Joints, Flue Ducts, Expansion Joint Sound Absorbers, Custom Rubber Hose, Metal Hose, Pump Connectors, and Metal Bellows Type Expansion Joints....now, all available in any combination of PTFE, Metal and Rubber, to suit your application.

This catalog outlines selection and installation of our Metal/Elastomeric/PTFE Bellows type expansion joint, Metal/Elastomeric/PTFE Hose and Pump Connectors for use in pipelines and process vessels to absorb motion and vibration in the system. Our designs incorporate the latest recommendation of the Expansion Joint Manufacturers Association and the Fluid Sealing Association.

Unaflex® is a full service engineering organization offering a full range of products in the highest grades of elastomers and stainless steel, as well as exotic alloys including Monel®, Inconel®, and Hastelloy®.

Quality control is rigorous and complies with requirements of MIL-1-45208 and MIL-Q-9858. We are ISO 9001:2008 certified and our expansion joints also comply with U.S. Coast Guard requirements. Certification is available.

Special PTFE Products

- Large diameter solid PTFE joints similar to styles 112, 113 and 155 available in sizes to 124' in diameter.
- PTFE lined metal hose—superior strength combined with chemical resistance.
- Corrugated PTFE sleeves—built to your specifications.
- PTFE lined flue duct —for superior resistance to corrosive ducting applications.
- PTFE tubes—various diameters and lengths, complete fittings also available.
- PTFE gasket material—precut or roll form.

2011 Revision

UNALON Styles 112A&E, 113A&E and 115A&E

Unaflex® “Multi-Purpose” PTFE Expansion Joint styles 112, 113 and 115 are solid-molded of PTFE and specially designed to withstand the higher pressures and temperatures of today’s piping systems. Their design allows a shorter face-to-face dimension, making them ideal for installation where space limitations are a factor. They are lightweight in design and corrosion resistant. Available in sizes 1” to 48” I.D. and for temperatures ranging from -300°F to +400°F.

Materials of Construction

112A & 112E, 113A & 113E, 115A & 115E	
Description	1"-12"
Bellows	PTFE T-62
Flanges	Ductile Iron
Reinforcing Rings	Stainless Steel
Limit Bolts	Carbon Steel
Nuts	Carbon Steel
Grommets	Neoprene
Washers	Carbon Steel

Note: Stainless Steel or Monel reinforcing rings available
 For greater pressures or safety requirements than shown, special overlays are available.
 Optional flow liners are available in: PTFE, Metallic, Elastomeric Stainless Steel, Nickel Alloy and Tantalum internal vacuum rings are available.

Consult our engineering department for further details.

PTFE-FEP

2011 Revision

Installation Instructions for Unaflex Expansion Joints Styles 112A&E, 113A&E and 115A&E

- Do not remove flange covers (and spacer sleeves) until expansion joint is to be bolted into position or sealing forces may become warped or damaged.
- Limit bolts with elastic stop nuts are factory set at the maximum travel position to prevent over-extension. Severe damage or personal injury can result if the limit bolts and stop nuts are removed, replaced, or altered to exceed the factory setting, or if non-locking nuts are installed. Install expansion joint and nominal setting except, when used to handle hot material, the units should be installed at nearly extended length to permit compression when piping expands due to heat. If used in chilled line, install at nearly compressed length to permit piping to contract.
- Sealing faces of expansion joints and adjacent flanges must be clean and smooth. Sharp corners and burrs on adjacent flange faces, and any extended scratches in either face, should be removed with fine emery cloth. If surface irregularities cannot be completely removed, it may be necessary to install a 1/16" thick gasket to obtain adequate sealing. Gaskets are recommended when connecting to flanges of dissimilar materials.
- Do not install nuts or connecting bolt heads behind expansion joint flanges or accidental wrench damage may occur to the TFE element. Expansion joint flanges are tapped with thread sizes to accommodate ANSI class 150 or optionally glass pipe bolt sizes. At most, two bolt threads should extend behind expansion joint flanges to prevent interference and possible damage when expansion joint is compressed. Do not bore cut threads.
- Do not overtighten bolts
- Expansion joints should not be tested to more than 1-1/2 times the working pressure as indicated in the following pressure/temperature curves. Anchors must also be designed to withstand test pressure conditions and all anchors and guides must be installed and checked prior to testing.

Nominal Size (inches)	1	1-1/2	2	2-1/2	3	4	5	6	8	10	12	
Flange Bolt Torque, ft.-lbs.*	10	15	25	30	40	30	40	60	75	70	75	
No. of Holes per Flange	4	4	4	4	4	8	8	8	8	12	12	
*Note: The values in this table are a guide. In some instances, higher torque may be required. However, excessive torque should be avoided. Do not exceed twice the given values.												

Bolt Torque Sequence

UNALON® Style 9500 Heavy Duty PTFE/Metallic Expansion Joints

The Unalon® 9500 series is an expansion joint that combines the properties of The Unalon® 9500 series is an expansion joint that combines the properties of metal and PTFE into the most advance, versatile expansion joint on the market today.

Unlike ordinary solid PTFE or Elastomeric type expansion joints, should up-set conditions exceeding 500°F occur, Unalon® series 9500 will maintain it's pressure carrying capacity up to 1200°F, adequate time for system shut-down and replacement.

Safety

The Unalon® 9500 series PTFE or FEP tubes are formed into a Stainless Steel, Inconel®, Monel®, or Hastelloy® corrugated tube.

Additional Types of Expansion Joints: Lined, Hinged, Dual and Universal Tied

Note: For environmentally corrosive applications; laminated, (multi-ply) bellows as well as the optional features listed below are available.

- Highly corrosive chemical-petrochemical systems
- Abrasive industrial process piping systems
- Power generating and waste water treatment plants
- Pulp/paper systems and marine services
- Pollution control systems

Optional Testing Procedures

- Radiography of longitudinal bellows seam weld
- (PMI) Positive Material Identification of Bellows

Optional Coatings

- Four-part epoxy coating for flanges
- Fluoropolymer coated flanges, threaded rod and nuts

The Unalon® 9500 Series will:

- Absorb pipe movement and stress
- Isolate mechanical vibration
- Reduce system noise
- Protect against surge forces

Working temperature from -300°F to +400°F

Working Pressure: 50, 150 and 300 PSIG (please specify). For pressure above 300 PSIG, consult factory.

Standard Testing Procedures

- Dye penetrant test of all pressure boundary welds
- **Spark test at 30,000 volts, exceeds industry standard of 10,000 volts**
- Hydro test at 1.5 times the design pressure for 10 minutes

Optional Features

- Special flange construction, configuration and materials
- Internal vacuum rings for full vacuum service constructed of Stainless Steel, Nickel Alloys and Tantalum
- Protective covers available in Stainless Steel and Nickel Alloys
- Internal flow liners available in Stainless Steel, Nickel Alloys and TEFLON®

UNALON® Style 9500

Design Movements

Movements as described are for axial compression and extension. For lateral movements, consult factory.

Note: Standard face-to-face dimensions as shown. Other dimensions available on request, consult factory

***Deflection Force/Spring Rate**

Consult factory.

WARNINGS: Safety shields must be used at all times in hazardous services to protect against serious personal injury in the event of expansion joint failure. Liner sleeves must be used in abrasive service or where sharp-edged solids are or may be present.

Dura-Perm PTFE Lined Spool Type Expansion Joints

Unaflex® “DURA-PERM” *FEP-lined Expansion Joints combine the features of FEP/PTFE for chemical resistance, anti-stick properties, thermal stability, and resistance to age cracking—with the best features of elastomeric expansion joints—good noise and vibration dampening, flexibility and high-pressure ratings. Temperature ratings to 400°F available. Sizes of 1” to 48” I.D. in standard face-to-face dimensions, or special lengths.

1/2”-12” are PTFE lined. 14” and above are FEP lined (Fluorinated Ethylene Propylene Copolymer).

- They are recommended for use in the chemical and pulp paper industries because of their capabilities to resist corrosive attack, high temperatures and pressures.
- Chemical resistance/anti-stick properties
- Noise and vibration dampening/high flexibility
- Thermal stability/resistance to age cracking
- High pressure rating/temperature rating of 400 degrees

Control Units

Excess elongation, caused by shifting of pipelines may seriously damage rubber expansion joints. This damage can occur when:

- Necessary support is not provided for the weight of the pipeline
low temperatures in the line are encountered
- The lines on the pressure side of the air compressors are not anchored properly. Such destructive elongation can be controlled with Unaflex® control units.

In general, control units are always recommended as an additional safety factor, preventing damage to the connector and associated equipment. Our experts will recommend the units appropriate for your installation. PTFE, more commonly known by the brand name Teflon® by DuPont™ is Polytetrafluoroethylene). PTFE is a synthetic fluoropolymer which finds numerous applications.

Construction Details Styles 150, 200, 200XL and 1000

Tube

The tube is a single-molded PTFE leakproof lining extending flange to flange. The outside of the PTFE tube is etched to adhere to the elastomeric overlay.

Carcass

This is a high strength woven polyester or Kevlar® reinforcing fabric between the PTFE tube and the cover.

Steel Reinforcements

These are the chemically treated solid round endless rings or high tensile strength helical wire embedded in the carcass. The steel reinforcement provides additional strength for pressure and vacuum service.

Cover

This is the exterior elastomeric overlay designed to protect the carcass from external elements.

Options

Flow liners are available in PTFE, metallic, or elastomeric type.

Special Constructions

Hinged, gimbal and dual. (consult factory)

Temperature Limits for Continuous Service

Series	Temperature F	Elastomeric Cover
150	250	Neoprene or Nitrile
200	250	Neoprene or Nitrile
200XL	250	Neoprene or Nitrile
150 HT	300	Butyl or EPDM
200 HT	300	Butyl or EPDM
200 XL/HT	300	Butyl or EPDM
150 V	400	Viton®
200 V	400	Viton®
200 XL/V	400	Viton®

DURA-PERM PTFE Lined Spool Type Expansion Joints

UNAFLEX® does not use marginal constructions which reduce safety factors and cause pressure reductions with slight operating temperature increases.

PTFE-FEP

2011 Revision

PTFE/Flexible Rubber Pipe Connectors

“Super-Quiet” Styles 3150 and 3250

Unaflex® “Super-Quiet” Styles 3150 (150 psi WP) and 3250 (250 psi WP) sound absorbers are built with molded rubber flanged ends with bolt holes that accommodate standard steel flanges. Available with or without helical wire reinforcement. Special tubes can be made to meet unique requirements for either suction or discharge.

IMPORTANT: Unaflex® Vibration and Sound Absorbers are not designed to accommodate the movement in a piping system caused by temperature change or other conditions. See Spool-Type Expansion Joints for such applications.

Percentage of Reduction of Vibration Input with Frequency and Pressure as Compared to Steel Pipe

Center Freq. Hz	8" I.D. x 24" F-F Vibration Joint		
	10 psig	50 psig	80 psig
440	87%	91%	93%
68	95%	96%	99%
125	98%	99%	99%
250	96%	97%	99%
500	91%	93%	94%
1000	82%	91%	96%
2000	99%	99%	99%
4000	99%	99%	99%
8000	97%	97%	98%

EXAMPLE: If a steel piping system had a major vibration frequency of 1,000 Hz at 50 PSIG and 8" rubber expansion joint was installed in the pipeline, the percentage of reduction of vibration would be 96%. Above data taken from the Fluid Sealing Association Handbook.

PTFE Lined Serpent Hose

Unaflex® combines the advantages of lightweight yet durable rubber hose, with PTFE's unsurpassed resistance to virtually all chemicals except molten Alkali metals such as Potassium, Lithium, and radium, as well as Fluorochemicals.

Serpent PTFE lined hose is an excellent choice for transfer service of acids, ester, acetone, aromatic hydrocarbons, organic chemicals and alcohols. Unaflex® hose is steam cleanable for short durations and is excellent for food handling services.

PTFE/Flexible Rubber Pipe Connector Construction Features

Tube

Smooth, non-stick PTFE or FEP tube.

Carcass

Rubber, reinforced with spirals of yarn and double spiral helix wire for maximum flexibility.

Cover

Standard Neoprene or EPDM for abrasion, weather and ozone resistance. Also pin pricked to allow for slight permeation through the outer cover if it should occur.

Lengths

Standard in 50 or 60 foot lengths. Shorter lengths available with built-in integral duck and rubber flanges with beaded ends where all wetted surfaces are PTFE.

Temperature Resistance

Up to 350°F with EPDM, up to 400°F with Viton® and Kevlar® reinforcement. Pressure ratings must be reduced as temperatures increase over 212°F.

Sizes

Serpent PTFE lined Rubber Hose is available in a wide range of sizes including large bore capacity up through 48" ID contact factory with your requirements.

Fittings

Unaflex® has the capabilities to build a duck and rubber flange or beading end into the hose which allows the PTFE liner to extend up the face of the flange or beaded end. These are tough durable fittings which have unique properties. Stainless steel swaged fittings are also available.

PTFE Lined Metal Pump Connectors

Unalon® Series 8000 PTFE combines the corrosion resistance of PTFE with the pressure and safety characteristics of stainless steel. corrugated hose and braid available with standard, metric or special flanges. Units can also be provided with floating flanges to facilitate installation.

For environmentally corrosive applications, these units can also be provided with vulcanized elastomeric coverings on the outer braid. Lengths up to 50' available.

Installation Recommendations

- | Do's | Don'ts |
|---|---|
| <ul style="list-style-type: none">• Inspect for damage during shipment, i.e. dents, broken hardware, water marks on carton, etc.• Store in clean dry area where it will not be exposed to heavy traffic or damaging environment.• Use only designated lifting lugs.• Make the piping system fit the expansion joint by stretching, compressing or offsetting the joint to fit the piping, it may be overstressed when the system is in service.• It is good practice to leave one flange loose until the expansion joint has been fitted into position. Make necessary adjustments of loose flanges before welding.• Install joint with arrow pointing in the direction of flow.• Install single Van Stone liners pointing in the direction of flow. Be sure to install a gasket between the metallic liner and Van Stone flange as well as between the mating flange and liner.• With telescoping Van Stone liners, install the smallest I.D. liner pointing in the direction of flow.• Remove all shipping devices after the installation is complete and before any pressure test of the fully installed system.• Remove any foreign material that may have become lodged between the convolution.• Refer to EJMA standards for proper guides. | <ul style="list-style-type: none">• Do not drop or strike carton• Do not remove shipping bars until installation.• Do not use hanger lugs as lifting lugs without approval of manufacturer.• Do not use chains or any lifting device directly on the bellows or bellow cover.• Protect with wet chloride-free asbestos.• Do not use cleaning agents that contain chlorides.• Do not allow weld spatter to hit unprotected bellows.• Do not use steel wool or wire brushes on bellows.• Do not force-rotate one end of an expansion joint alignment of bolt holes. Ordinary bellows are not capable of absorbing torque.• Do not hydrostatic pressure test or evacuate the system before proper installation not all guides and anchors.• Pipe hangers are not adequate guides.• Do not exceed a pressure of 1-1/2 times the rated working pressure of the expansion joint.• Do not use shipping bars to retain the pressure thrust if tested prior to installation. |

Additional Suggestions

- Clean all foreign matter and remove burrs or sharp edges from flanges
- All pipelines should be properly supported so that the expansion joints do not carry the pipe load
- Remove burrs or sharp edges from flanges
- Do not install joints on raised face flanges of more than 1/16"
- All pipes are to be lined up accurately before installing expansion joints. Offset joints should be installed where misalignment is greater than the lateral movement allowed by the joint construction
- Bolts should be on the inside of the joint flange. Metal washer must be placed at the facing of the split retaining ring
- Bolts should be tightened by alternating around the flange and all tightened equally
- Slight gouges or abraded areas caused by tools or bolts during installation should be sealed with rubber cement and painted to prevent deterioration of the carcass
- Bolt tightness should be checked one week after going on stream and periodically thereafter
- If system is not anchored to insure against movement beyond maximum stated limits, a control unit must be used

Technical Information

Flange Bolt Torquing for Unaflex® PTFE-lined piping products

General techniques utilized to install flanged carbon steel piping systems may also be applied to Unaflex® PTFE-lined piping systems.

When assembling flange connections, it is recommended that a full complement of clean, new and high-strength A193-B7 bolting is consistently utilized. When stainless steel bolting is used, consist of A 320/A320M Class 2 B8 (304 SS) or Class 2 B8M (316 SS) with A 194/A194M Grade 8 or 8A Nuts (for 304 SS) or Grade 8M or 8MA (for 316 SS). When other bolting materials are employed, user should ensure new bolting material strength properties exceed the calculated bolt stress values generated in establishing the piping connection.

The following practices are strongly recommended:

- Always utilized flat washers on both sides of the connection
- Ensure that the flange bolts are tightened with a calibrated torque wrench expressly for the specified bolt torques. Note: For anti-seize compounds, the torque values may vary. Please contact Unaflex® for more information
- Firmly secure the flange bolts with a torque wrench utilizing a “crisscross” pattern that alternately tightens the bolts located 180 degrees apart
- Employing the above mentioned pattern, tighten the bolts in 20% increments of the final bolt torque until 80% of the final bolt torque has been accomplished
- To tighten the final torque values, firmly tighten bolts sequentially clockwise one time around the flange. This procedure ensures the bolts have been evenly stressed
- Extreme caution should be taken to avoid over-torquing which can result in damage to plastic sealing surfaces

NOTE: When bolting dissimilar materials, always tighten to the lowest recommended torque of the components in the joint. Employing higher torques may cause excessive deformation of the “softer” material contained in the joint. Position a ½” thick spacer between Unaflex PTFE-lined pipe or fittings and other plastic-lined components, particularly valves, should differences in the diameters of the raised plastic faces occur. *Belleville washers are not recommended for use with PTFE-lined products.

Retorquing

A retorque should be applied a minimum of 24 hours after the initial torque or after the first thermal cycle. Retorquing enables seating of the plastic and allows for the relaxation of the bolts. In the event that the system is intended to perform at elevated temperatures, hot water should be circulated at the maximum operating temperature of the process (if possible) for at least 24 hours. This process will allow the pipe system to experience one full thermal cycle.

After cool-down, retorquing of the system should be completed. Torquing need only be completed on the system in the ambient, cooled state and never while the process is at an elevated temperature. This could cause excessive force to be exerted to the plastic faces. Never attempt to disassemble a flange joint in a hot system. Wait until the system has cooled to ambient temperature.

Technical Information

Hydrotesting

Typically after initial torque and retorque, a hydrotest should be carried out utilizing ANSI requirements. Experience has demonstrated that if the aforementioned procedure is adhered to, very few, if any flange joints will fail the hydrotest. If a flange joint leaks, first re-check the torque values and tighten in 10% increments over the specified bolt torques until completely sealed. If, however, 150% of the specified torque value has been reached and the flange joint continues to leak, stop the process and disassemble the flange joint. It is likely that something else is wrong, i.e, a scratched plastic face.

The hydrotest must be successfully completed, and any existing leaks corrected before the pipeline can be approved and commissioned.

Annual Retorquing

Retorquing should be completed a minimum of annually thereafter. This is particularly crucial if the process line experiences elevated temperatures or extreme ambient temperature exposure. Torquing should only be completed on the system in the ambient, cooled state. Never attempt this process at an elevated temperature as damaging excessive force may be applied to the plastic faces.

STANDARD WARRANTY

All merchandise sold by UNAFLEX[®] is subject to this Standard Warranty. Our products are warranted to be free from defects in material or workmanship. Our liability for breach of any and all warranties, expressed or implied, is limited to refunding our invoice price of the product, or at our option, to replacement of the product. If any product manufactured by UNAFLEX[®] is found by us to be defective either in material or workmanship, under proper usage and service, the invoice price will be refunded or at our option will be replaced free of charge including transportation charges, but not cost of installation. The refund of the invoice price or the replacement of the product is the maximum liability of the company. The sale of our products under any other warranty or guarantee, expressed or implied, is not authorized by the company.

Technical statements and engineering data in this catalog is the most accurate information available at the time of printing and are subject to change without notice. As UNAFLEX[®] does not supervise or control the use of our products, UNAFLEX[®] cannot be responsible for improper use or misapplication of catalog data.
